

master your communication

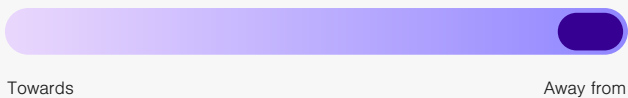

Date of submission 22/07/14

mercurious report
Ricardo Sibani, CPO

Your profile – summary

Motivation pattern

You tend to be driven by away-from communication pattern.

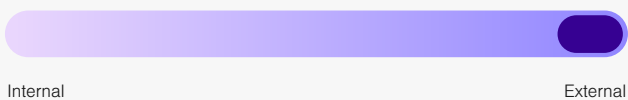

Understanding pattern

You tend to be mostly driven by procedure communication pattern.

Decision pattern

You tend to be driven by external communication pattern.

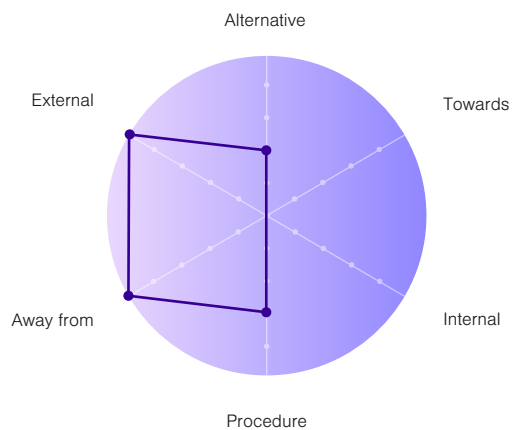

Primary communication channel

The most recurring pattern in your report tend to be sound-based communication. Auditiv.

Communication pattern profile

Comments

You tend to focus on problems and are flexible in your solutions. You think about the approach and the structures to solve the challenges that exist and different options that support the structure. You are very receptive to feedback and may risk being interpreted as insecure by those with an internal language pattern. Attentative to feedback. Problemsolving oriented.

This summary is explained in full in the following pages. This is primarily intended to provide you with an overview of your communication patterns.

**How do you
understand
that you've
understood
what you
understand?**

Pattern #3

Understanding

If we don't understand each other we misunderstand each other. The importance of creating understanding in our leadership and relations to others is crucial to achieve success and avoid conflicts. When we understand each other, the motivation and sense of connection increases.

To understand how we create clarity and understanding is the difference between efficiency and inefficiency. Similarly it is crucial to seek to increase understanding with more people no matter if your role is in sales, management or administration.

Motivation pattern

When these two patterns communicate with each other, misunderstandings often occur if the relationship is strained in any way. We all prefer one of the patterns and when trying to clarify our communication, we tend to reinforce our preferred pattern rather than adding the other one. By adapting your communication to allow more people to understand you, you increase motivation and decrease misunderstandings. When we know how to create understanding for others and what we need in order to understand others, we become better communicators.

Two different needs of understanding

Understanding is based on the structure of information being logical—whether spoken or written. Everything we communicate has a certain order and this order emerges from two fundamental needs. We either need a logical order for what we're communicating, or we need different examples and variations.

We may have access to both of these needs and can shift between them depending on context. We may, for instance, need logical procedures for our work life but alternatives for our private life. However, it is very rare to need both patterns in the same context.

Understanding patterns in communication

Those who have procedure-oriented communication pattern tend to focus on "how" rather than "what" in the communication. They seek the logical connection and to understand how things are linked. This means they tend to focus on what is being framed in the communication if there is a logical structure one can follow. For instance, the numbered agenda, how it will be done, what happens first, what happens next and what happens last. Those who have alternative-oriented communication pattern tend to focus on different examples in the communication. They seek different possibilities and other ways than the obvious one. This means they tend to focus on what lies outside of what is being said, and often challenge the given structure. For instance the "other" or "misc" topic on the agenda, other examples, what else could be imagined.

The extreme

For those with procedure-oriented communication, the order of things can become more important than what is being said. If you, for instance, stray from the agenda or the given time frame, you might be perceived as lacking seriousness by those with procedure communication.

For those with alternative-oriented communication, the need to challenge the structure can become more important than what is being said. If you, for instance, follow the agenda too strictly, you might be perceived as provocatively boring by those with alternative communication.

Pattern for understanding Procedure

Understanding pattern; procedure

It is important that what is being said is logically connected. Otherwise it gets messy.

100% Procedure

When you communicate and listen to others, you need a logical structure to follow. It can be a time-based chronological order or a prioritized list. The information must logically fit together. You can easily follow structures and you enjoy order. When you create understanding for others, you are clear with the order you communicate in. There needs to be a logical structure. If it is not logical, it becomes challenging for you to listen. It's important for you that agreed times are honored and that agreed structures are followed. Unfinished messages and projects can make you stressed. A list of activities must be prioritized for you to experience it as clear. Things must be done right from the start and follow the right order.

In some cases

During conflict with others, the conflict can worsen for you if the context is not logical and time is not honored. When you talk about something that's important for you, others might perceive you to be slow and long-winded.

General professions

It is very common among executives and leaders to fit this profile. In middle management, the ratio is approx. 50/50.

When the relationship is good

Those with "procedure" and "alternative" understanding pattern work effectively together when the relationship is good and both parties have a clear structure and a clear frame for what is to be done.

Develop your communication

When aiming to be clear, you can use statements such as; "Firstly. Secondly. Thirdly.", "In what order should it be done?", "How should it be done?".

Important to keep in mind

Your result indicates that you clearly have procedure as your understanding pattern. You need structure, logical order, and that information fits together. In conversation with others you tend to focus more on "how" than anything else. When you answer a "why question", you tend to answer by explaining how you found the answer rather than answering the question at hand. You are skilled at following a set structure and communicating one thing at a time. Being surrounded by people with alternative pattern might be challenging for you since you might be perceived to be rigid in extreme cases.

When you listen to others

Procedure - Procedure

Those with procedure understanding pattern tend to easily find agreement with each other. In a team, they may prefer clear instructions, role definitions, priorities and time frames. In some cases they need guidance to get started. A team of only procedure-oriented patterns tend to become inefficient without clear structures. In conversation, they focus on "how" rather than "who", "what", and "why".

Procedure - Alternative

Those with procedure and alternative understanding patterns work efficiently together when the relationship is good. During conflict, those with procedure pattern tend to focus on "how" things happened—how it started, what happened then, and how it ended. This collaboration improves if you agree on the frame for what is to be done, and the order it is to be done in. Boundaries and priorities bring about efficiency.

How others are impacted by your communication

Procedure - Procedure

Those with procedure pattern easily understand each other. They perceive each other to be clear, logical and to the point.

Procedure - Alternative

Those with procedure and alternative patterns have difficulties understanding each other when the relationship is challenging. Those with alternative pattern might perceive those with procedure pattern to be boring, slow and not getting to the point. Those with procedure pattern might perceive those with alternative pattern to be unclear, unprofessional and not serious.

Good for the leader to know

If you are leading someone who has procedure pattern, you must be clear regarding instructions and honoring agreements for instance regarding time. At times, you might have to assist in prioritizing tasks. Following a clear agenda in meetings is welcomed, and you should never end a meeting later than agreed. The lack of clear structure might result in the individual not getting started with the tasks at hand. Always be clear with your mutual expectations.

Stressed procedure

Support those with procedure pattern in finishing unfinished projects. Support with clear routines and structures for the daily work. During stress, a coworker with procedure pattern needs clear boundaries, expectations and priorities.

To develop

Learn what routines and expectations are important for you in your life, in order for you to function well. Practice peeling off unnecessary structures limiting your work flow. You risk focusing too much on "how" things are done, which might prevent you from getting started. When meeting people with alternative understanding pattern, your own understanding will be facilitated by taking notes on what is being said and creating your own list of priorities.

Strengths

You carefully follow given instructions and framing, which makes you an important team member in development projects. You contribute with order, logical thinking and sustainable structures. alternative pattern to be unclear, unprofessional and not serious.

**What makes
you take the
extra step
needed?**

Segment #4

pattern: motivation

How do you motivate yourself and others? Motivation is a crucial resource for driving change. To understand what we ourselves need to be motivated and what others need, is not always the same thing and can often create misunderstandings. What motivates you might not be the same fundamental driver that motivates your partner, boss, coworker or colleague.

Motivation for action

Underlying motivation is a clear motive for why you act. When we know why we do what we do, the experience of motivation and empowerment increases. The more clear our reason to act is for us the more powerful the motivation and the more foreful the action. It is when we act that we are motivated in our lives. To hope or wish for something may be motivating, but we cannot call ourselves motivated until we act upon what lies ahead for us.

Two different directions

There are two different directions when express motivation. Sometimes we act to achieve what we associate with joy. Sometimes we act to avoid what we associate with pain. In spoken language this is often referred to as "towards-oriented" language and "away from-oriented" language. We may have access to both directions in our communication, which is often contextual. You may, for instance, have towards-oriented communication pattern in the workout contexts, while you have away-from-oriented communication pattern in work contexts.

Motivation patterns in communication

Those who have a towards-oriented communication pattern tend to focus on what they wish to achieve, move towards, forward-looking results and effects associated with the direction towards something connected to joy. For instance succeeding, being included or being right.

Those who have away from-oriented communication pattern tend to focus on what they wish to avoid, move away from, problems and potential scenarios associated with the direction towards something connected to pain. For instance failing, being excluded or being wrong.

Note that for the towards-oriented pattern it is positive to achieve joy. Similarly it is positive for the away from-oriented pattern to avoid pain.

The extreme

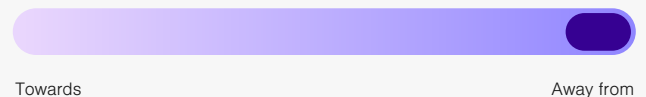

Those who have towards-oriented pattern might be perceive those who have away from-oriented pattern to be downright demotivating—and vice versa.

Pattern for motivation away from-oriented

Away from-oriented motivation pattern

You tend to be driven by away from-oriented language when motivating yourself and others.

More about away from-oriented communication

In some cases

When others highlight future plans without sufficient risk assessment you might get annoyed and experience them to lack seriousness.

When the relationship is good

Towards- and away from-oriented who have a good relationship without conflict can be excellent collaborators. A balanced mix of towards- and away from-oriented team members is optimal for making a project successful.

Develop your communication

Sentences that tend to motivate you may include;

"Let's deal with the problems at hand"

"Let's make sure to avoid and eliminate any problems"

"Let's make this a frictionless journey"

100% Away from ←

You motivate others by being clearly away from-oriented in your communication. You are motivated by avoiding mistakes and you're good at spotting problems. You know what to avoid in order to stay focused. You are motivated by making sure nothing limits access to what you associate with avoiding the experience of pain. When planning a work trip, you focus on avoiding obstacles along the way.

Important to keep in mind

Your result indicates that you are a towards-oriented communicator. You focus on problems in the future and you engage others who communicate in the same way. You also listen more to those who share your focus on obstacles and problems along the way.

You might—by those with towards-oriented pattern—be perceived to be negative and lacking engagement in your communication. It can be a challenge for you to listen to those who have towards-oriented motivation pattern. You might easily lose interest and others can tell that you are distracted.

In extreme cases you might get annoyed and perceive towards-oriented communicators to lack seriousness. This may cause unnecessary conflicts and misunderstandings.

”...I don’t have to do anything, everything just flows ...”

When you listen to others

Away from - Away from ← ←

You are motivated and get energy by talking about problem-solution with others who share your away from-oriented communication pattern.

Away from - Towards ← →

You are demotivated and lose energy by talking to others who have towards-oriented communication pattern—especially if the relationship is tense or negative. You sometimes risk getting noticeably annoyed when listening to others who have an excessive towards-oriented communication pattern.

General professions

Professions with a high representation of this pattern include; developers, accountants, legal advisors, nurses, etc. When planning a work trip, you focus on avoiding obstacles along the way.

How others are impacted by your communication

Away from - Away from ← ←

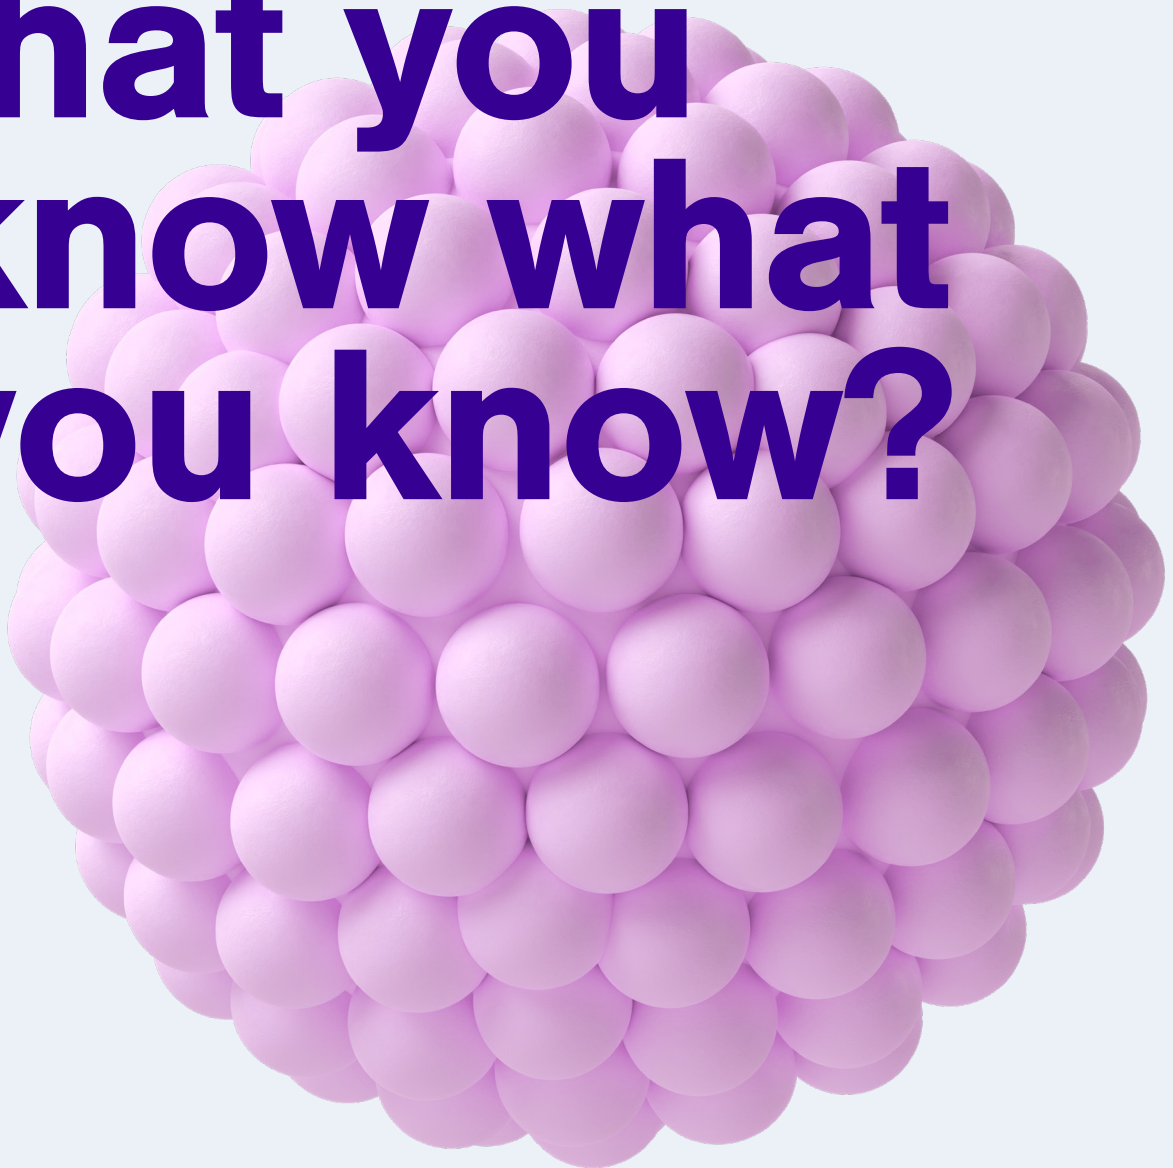

You are perceived to be a serious and professional person by those who have away from-oriented motivation pattern. They get noticeably motivated by your way of communicating.

Away from - Towards ← →

You can sometimes be perceived to be a negative person by those who have towards-oriented motivation pattern. They can get noticeably demotivated by your way of communicating. You have trouble engaging those who have towards-oriented motivation pattern.

**How do
you know
that you
know what
you know?**

Segment #5

pattern: decisions

Understanding how we make decisions is crucial for understanding what we and others need when making decisions. It impacts how we motivate and how we are motivated. How you motivate yourself to make a decision is not necessarily the same way someone else does. We simply need different things to motivate ourselves to make a decision.

We have two different sources of information for motivating ourselves to make a decision. We tend to prioritize the information source we primarily need, and give less attention to the communication pattern which doesn't represent our personal need. The stronger the connection between the information source and our communication pattern, the more certain we feel in our decision making.

Two different sources

There are two main information sources we put our trust in when making decisions. One is our gut feeling (internal) and the other is feedback (external). In our communication, this is most clear in how we approach feedback and who is giving the feedback. When seeking feedback from others, this pattern impacts how we make decisions. We rarely have both the internal and the external pattern in our communication—yet we can have different patterns in different situations.

For instance, you may have internal communication pattern at work and external communication pattern at home.

Decision patterns in communication

An individual who has internal decision making and communication tends to focus on their own feeling before making a decision. The gut feeling decides. When someone who has internal communication pattern seeks feedback, it is to confirm one's own feeling.

An individual who has external decision making and communication tends to focus on feedback from others and external sources before making a decision. Feedback has the most impact on the decision. When someone who has external communication pattern seeks feedback, it is to find more sources for basing one's own feeling upon.

Decision patterns and feedback

An individual with internal communication pattern reacts negatively to feedback which is not aligned with one's own gut feeling. Those with external communication pattern need feedback to make decisions. Those with internal communication pattern give very little feedback—but they believe they give a lot. Those with external communication pattern give a lot of feedback—not understanding that they sometimes give too much. A common misunderstanding in the relation between internal and external is the need for feedback. Those with internal decision pattern need some feedback, but not from everyone. Those with external decision pattern value feedback from everyone.

The extreme

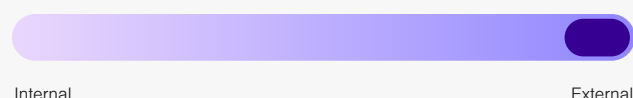

Conflicts and misunderstandings are fairly common between internal and external communication patterns—since the external might perceive the internal to be egotistic. Similarly the internal might perceive the external to be overly verbal and demotivating.

Pattern for decision making external source

Externally-sourced decision making

Feedback from others is important for you when making a decision. You enjoy both giving and receiving feedback.

100% External

Feedback is important for you—preferably from different people with different opinions, but also other sources. You base your decisions primarily on the feedback you receive from different sources. You can change your opinion if the feedback is correct—even if it doesn't match your own gut feeling. When you are hesitant, you prefer asking different people for advice and take their opinions into account before making up your mind. If you are making an important decision, you first collect facts, comments and perspectives from different sources before deciding within yourself what to do. You can change your mind if the source or the feedback seems relevant enough. Even if your own opinion is completely the opposite, the right feedback can make you change your decision. If you, for instance, have decided that your own performance was not satisfactory, you may change your mind based on any feedback claiming the opposite.

In some cases

If the feedback varies, you might find it difficult to make a decision. You likely have a great need of feedback, which is not to be confused with validation.

General professions

It is rare among executives and leaders to fit this profile. In middle management the ratio is approx. 50/50.

When the relationship is good

Those with internal and external decision patterns collaborate well when the relationship is good and both parties have agreed on how to give feedback. However, the one with internal pattern tend to direct the conversation.

Develop your communication

When you aim to be clear, you can use statements such as; "What do you think?", "What do others think?", "Are there more relevant sources of information to consult?"

Important to keep in mind

Your result indicates that you are clearly external in your decision making. Your need for feedback directs most of your decisions. In conversation you tend to focus on various forms of feedback. You listen to others, including those who don't agree with your opinion.

You might be perceived as insecure and in need of validation. Those with internal decision pattern may perceive you to be a good listener.

In extreme cases you might perceive those with internal pattern to be egotistic and self centered. This may cause unnecessary conflicts and misunderstandings.

”...If other people were not able to achieve better ...”

When you listen to others

External - External

When those with external decision pattern listen to each other, they risk not reaching a decision. They tend to give feedback rather than making decisions. There is a lot of talking, and it's easy for others to join the conversation. Those with external decision pattern may be easily influenced but your communication to them will be perceived as feedback rather than orders. Those with external decision pattern need to practice not listening to all feedback.

External - Internal

Those with external decision pattern might find it hard to reach those with internal decision pattern. They might perceive those with internal pattern to be self-centered and bad listeners. They might find questions from those with internal pattern pointless to answer, since they perceive those with internal pattern have already made up their minds. Those with external decision pattern might be perceived to be insecure and dependent on others—which is usually an incorrect interpretation. Those with internal pattern perceive those with external pattern to be insecure.

How others are impacted by your communication

External - Internal

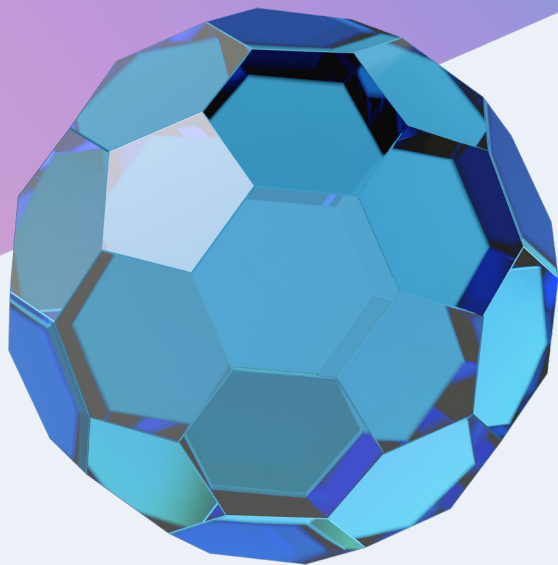

You are perceived to be a good listener.

External - External

You might be perceived as insecure and feeble in your decision making, because of your need for feedback from multiple different sources. If the relationship between you and someone with internal pattern is good, you are perceived to be a good listener.

**I see you.
I hear you.
I feel you.**

Segment #6

pattern: senses

We are using our different senses in our communication. We often use words that are sense specific. Do you see what I mean? Maybe you think about the challenges you feel coming? A skilled communicator has a high level of flexibility when it comes to communicating using our senses in different ways. The challenge is that we may have different sensory preferences.

The brain and our senses

The brain and neurological systems receive signals from the sense organs and other body parts—and based on this information the body's functions are controlled. The senses—sight, hearing, smell, taste and touch (reacting to pain, touch, cold, heat)—are necessary for our survival. The brain is involved in most things we do, feel and experience. It gives us our personality and our emotions. It is the brain that allows us to think and remember. The brain also controls bodily functions, such as our senses and movements.

The lobes have different tasks

The brain lobes have different tasks. The frontal lobe directs all muscle movements that are will controlled by will. In the temporal lobe lies the center for sensation and taste. In the temporal lobe also holds the center for hearing and smell. In the occipital lobe lies the visual center.

The parts of the body that you use the most, or that are the most sensitive, need the most space in your brain. Therefore, the areas that control the hands, mouth, lips and tongue take up a large space in the brain.

The brain can change

The brain has the ability to adapt and change—it is plastic. It can change its structure by creating new connections between nerve cells. The brain develops until we are about 20 years old and remains plastic throughout life but to a much lesser extent in adulthood than in childhood. We benefit from that when we learn new things or when the brain recovers from an injury.

Seeing, hearing & feeling touch

Depending on the situation we all have a so-called sensory preference. That means we prioritize one sense over another in a given situation. The preference can be so dominant that the sense we usually rely on is the same in different situations, or we rely on different senses in different situations.

The three priority channels are seeing, hearing and kinaesthetics (touch). To identify which channel tends to be dominant, we look for a sense-specific indicator word or words that act as synonyms for the respective sense.

Do you see anything of interest? (seeing)

Do you think of anything? (hearing)

What do you feel about your choice? (kinaesthetics)

If a person you are talking to tends to talk with visual (Sight), auditive (Hearing) or tactile (Kinaesthetic) metaphors, adapting your communication and reinforcing by using the same type of metaphors increases the likelihood that you will understand each other.

Pattern in overall communication

Auditive

100% Auditive

If you have an auditive primary channel for your communication, you tend to have a still body language. You listen with your ears and not with your body. When you express yourself, you have very little active body language. You may be negatively affected by loud voices or music. You who have an auditive primary channel prioritize how things sound. You think auditorily, which means that your thoughts are voice and volume—from the left or right side of the brain depending on the content of the thoughts. When you describe things, you use words that strengthen its meaning.

In some cases

If you have hearing as the primary channel for your communication, you tend to be quieter in your body language the more interesting it is, or the more focused you are.

Your attention

When you talk to someone else, you tend to use your ears more than your eyes. You can listen very effectively by turning your ear, something that can frustrate those with primary channel vision, as they easily interpret it as disinterest.

You emphasize the tone, tempo, tone of voice and choice of words when you communicate. You have a quieter body language than those whose primary channel is sight or touch.

Develop your communication

To develop your body tracking, here are some tips:

When you talk to someone who has sight as their primary channel, you benefit from looking them in the eyes when they speak or also becoming more active in your body language.

When you talk to someone who has feeling as their primary channel, you should remember that they convey the feeling of what they say, which can be perceived as overacting to you.

Develop even more

To become more effective and flexible in your communication, you will benefit from using words that are sense-specific for the other senses than your own primary channel.

If you have hearing as your primary channel, you need to practice sight and touch metaphors.

Do you see what I mean?

Do you know what I mean?

Date of submission 22/07/14

mercurious report
Ricardo Sibani, CPO
